

Electrolysis Post-Treatment Care

Most people exhibit little or no post-treatment issues. Issues might include puffiness, redness, irritation, or small scabs. These are temporary and are dependent on the coarseness and density of your hair. Good hygiene is an essential part of your post-treatment care. Your skin is a protective barrier. It takes about 24 to 48 hours for a treated area to begin healing. For this reason, please follow post-treatment procedure.

1. Keep hands off treated area.
2. Use a cold compress in the area daily if area continues to be red.
3. Cleanse your skin gently with mild cleanser.
4. Do not rub, scratch or squeeze. Avoid use of abrasives, loofas, or chemical exfoliants the first 24 hours.
5. Avoid the use of heavy creams or makeup to the treated area is skin is irritated.
6. Do not swim in non-chlorinated water or use saunas, hot tubs/ bath or other sources of extreme heat for 24 hours.
7. Avoid tweezing, plucking or waxing of visible hairs. Clipping or shaving is preferred. Please notify if you used bleaching products or hair inhibitor creams. Discontinue usage.
8. Avoid tanning for three days in the area that has been treated.
9. Do not pick tiny scabs. Please consult Lasting Image if these appear and instruction will be given.
10. Avoid stimulants prior to treatment to insure a comfortable treatment.
11. Use: _____
